STRUCTURAL PRE-ANALYSIS TABLES

The calculation model for KLH® solid wood panels must consider the influence of the layup (thickness, material, orientation), the internal stress distributions and local stress concentrations. Due to the shear flexible transverse layers, shear deformation may no longer be disregarded and the layup of the panel has to be taken into account.

Dimensioning and structural design follow Eurocode 5 (EN 1995-1-1 and EN 1995-1-2), taking into account the national standards set forth in ÖNORM B 1995-1-1 and ÖNORM B 1995-1-2. It should be pointed out that the national standards in various European countries differ from each other in some detailed aspects (e.g. different partial factors γ_M for "cross laminated timber" material). The material properties of KLH® solid wood panels required for structural design can be taken from the European Technical Assessment (ETA-06/0138).

The structural design of KLH® solid wood panels has to be carried out project-based and locally applicable standards and regulations have to be taken into account.

Due care is also advised when comparing panel thicknesses of KLH® elements with products from other manufacturers: due to different production processes, the cross laminated timber products may well have different properties, e.g. with respect to bending stiffness or shear strength. Please mind the relevant properties in the respective product approvals and take into account the differences in a comparative analysis.

For the structural analysis of cross laminated timber, different models have been developed in the past. The structural analysis of KLH® solid wood panels is based on the shear-elastic beam theory (according to Timoshenko) or the shear-elastic orthotropic plate (according to Reissner-MinTLin). The properties of the composite cross section are thereby described appropriately. To receive correct results (internal forces and moments as well as deformations) is the use of suitable software for the purpose of structural analysis. The software provided by KLH Massivholz GmbH (www.klhdesigner.at) is based on the above mentioned theory and thus a good choice.

01 KLH®-CLT | STANDARD PANEL TYPES AND STRUCTURES

FOR THE WALL

Covering layer in the transverse panel direction TT

Nominal thickness		Layers	Type	Lamella structure in [mm]						
				T	L	T	L	T	L	T

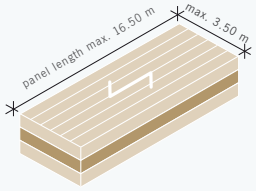
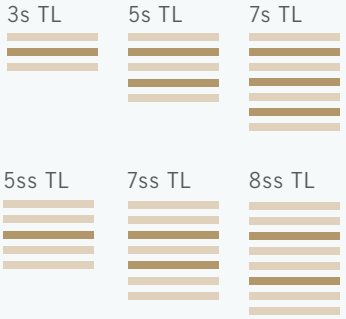
KLH	320 mm	8ss	TL	40+40	40	40+40	40	40+40		





Special panel layups are available on request. By using double layers, for example the longitudinal or transverse stiffness of the panel can be further enhanced. The fire resistance of the KLH® solid wood panel can also be influenced by modifying the structures and can eventually be improved in relation to specific project requirements.

Invoicing widths
2.45 | 2.50 | 2.73 | 2.95 |
3.10 | 3.20 | 3.30 | 3.40 | 3.50 [m]

Maximum length 16.50 [m]
Maximum thickness 0.5 [m]

02 GENERAL REMARKS

Dimensioning according to
ETA-06/0138 together with
ÖNORM EN 1995-1-1:2019 and ÖNORM B 1995-1-1:2019 or
ÖNORM EN 1995-1-2:2011 and ÖNORM B 1995-1-2:2011
per m wall length resp. per m² floor area

Impacts

Service class 1 (k_{def} = 0,6)
Self-weight of KLH® - CLT G_1 and the build-up G_2: k_{mod} = 0,6
Imposed load category A and B (ψ_0 = 0,7 and ψ_2 = 0,3): k_{mod} = 0,8
Imposed load category C (ψ_0 = 0,7 and ψ_2 = 0,6): k_{mod} = 0,9
Imposed load category H (ψ_0 = 0,0 and ψ_2 = 0,0): k_{mod} = 0,9
Snow load at an altitude ≤ 1000 m S_2 (ψ_0 = 0,5 and ψ_2 = 0,0): k_{mod} = 0,9
Wind load W (ψ_0 = 0,6 and ψ_2 = 0,0): k_{mod} = 1,0

Verification of Ultimate Limit States (ULS)

Verification of column stability, bending and shear resistance
Verification in case of fire (with charring rates according to ETA-06/0138 for minimum panel widths of 30 cm)

Verification in the Servicability Limit States (SLS)

Limitation of deflection
Verification of vibration

Verification criteria in detail

ULS tensions: limitation of the utilisation to 90 %
Fire case: limitation of the utilisation to 100 % and deformation limit to ℓ/80
SLS deformation: limitation of the utilisation to 90 %
- characteristic design situation: $w_{inst} \leq \ell/300$
- quasi-permanent structural design situation: $w_{net,fin} \leq \ell/250$

SLS vibration:
- floor class I (e.g. separating floor slabs for apartments or offices); 6 cm wet screed floating on heavy filler or dry screed floating on heavy filler (at least 60 kg/m²)
- floor class II (e.g. detached house); 6 cm floating wet screed (even without filler) or dry screed , floating on heavy filler (at least 60 kg/m²)
- modal damping ratio ζ = 4,0 %
- ratio floor slab width to span width $b/\ell \geq 1,2$

Cladding

For the cladding directly to the KLH® surface, screw-fastened fire rated gypsum plasterboards type F (GtF according to ÖNORM EN 520 and ÖNORM B 3410 or DIN 18180) or equivalent panels respectively free-standing studworks are required.
The fastening needs to comply with the state of the art and the current KLH® installation guidelines.

2.2 SYMBOL EXPLANATION

Service class 1 (deformation factor k_{def} = 0,6)

KLH® - CLT as **wall**

KLH® - CLT as **floor**

Single-sided fire exposed **wall**

Double-sided fire exposed **wall**

Single-sided fire exposed **ceiling**

Self-weight of the **KLH® - CLT panel**: k_{mod} = 0,6

Self-weight of the **build-up**: k_{mod} = 0,6

Imposed load **category A** (ψ_0 = 0,7 and ψ_2 = 0,3): k_{mod} = 0,8

Imposed load **category B** (ψ_0 = 0,7 and ψ_2 = 0,3): k_{mod} = 0,8

Imposed load **category C** (ψ_0 = 0,7 and ψ_2 = 0,6): k_{mod} = 0,9

Imposed load **category H** (ψ_0 = 0,0 and ψ_2 = 0,0): k_{mod} = 0,9

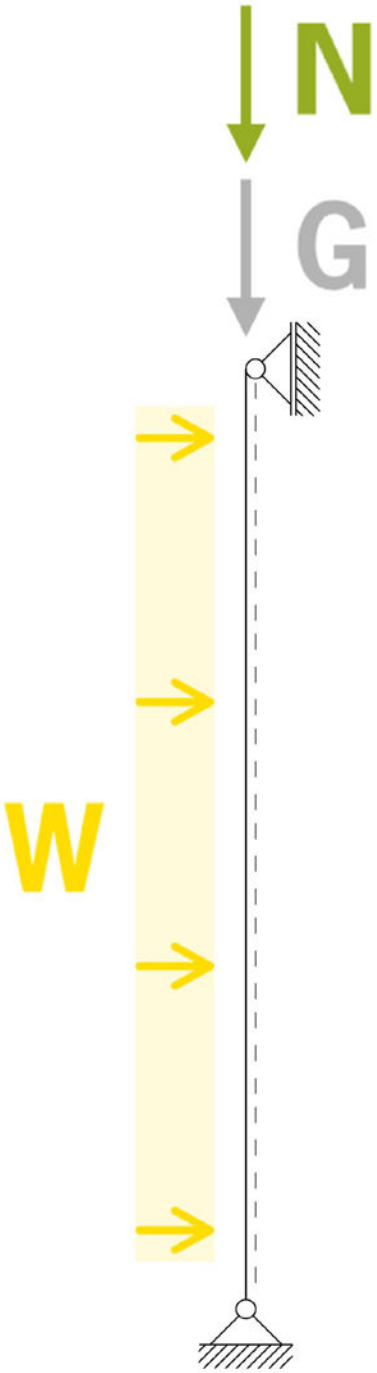
Snow load at an **altitude ≤ 1000 m** S_2 (ψ_0 = 0,5 and ψ_2 = 0,0): k_{mod} = 0,9

Wind load W (ψ_0 = 0,6 and ψ_2 = 0,0): k_{mod} = 1,0

Floor class I (e.g. separating floor slabs for apartments or offices)

Floor class II (e.g. detached house)

03 KLH® AS WALL



Range for loads

Permanent load: $G_{2,k}$ = 20 - 100 kN/m
Imposed load category A: $N_{A,k}$ = 20 - 100 kN/m
Wind load: W_k = 1.0 kN/m²

Wall height (buckling length)

2.95 m
3.50 m

Surfaces

Wood; KLH® - CLT visible
1 x 12.5 mm Gt-F
1 x 15 mm Gt-F
2 x 12.5 mm Gt-F
Studwork; free-standing (build-up: 15 mm Gt-F + 50 mm metal studwall/rock wool + 5 mm air gap)

Verification criteria in case of fire

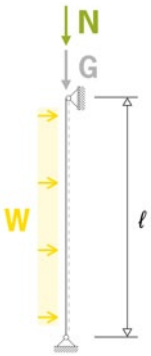
Single-sided fire exposure

Remaining of an at least 3-layers residual cross-section with two load-bearing layers, where each layer must have at least 10 mm (calculated with global charring)

Double-sided fire exposure

30/60 minutes: remaining of an at least 3-layers residual cross-section with two load-bearing layers, where each layer must have at least 3 mm (calculated with local charring)
90/120 minutes: remaining of an at least 3-layers residual cross-section with two load-bearing layers, where each layer must have at least 7 mm (calculated with global charring)

3.1 SINGLE-SIDED FIRE EXPOSURE (FOR EXTERIOR WALLS)



Minimum panel thicknesses for various fire resistances (R 0 to R 120), wall height 2.95 m

The self-weight $G_{1,k}$ of the load-bearing KLH® elements is included in the tables.

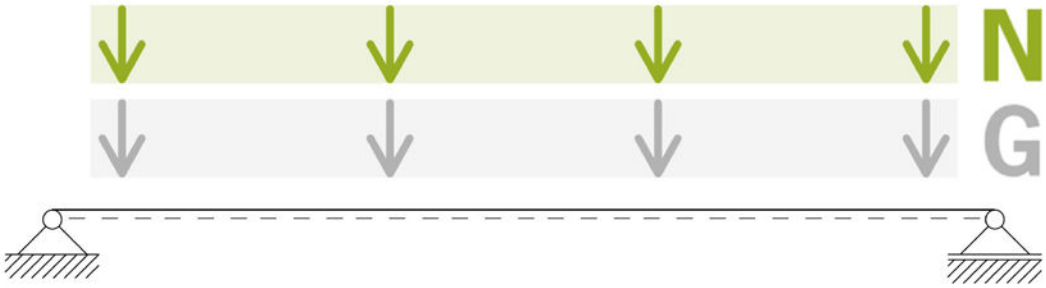
04 KLH® AS FLOOR



Range for loads

Permanent load: $G_{2,k}$ = 1.0 - 3.5 kN/m²
Imposed load category A: $N_{A,k}$ = 2.8 kN/m²
Imposed load category B: $N_{B,k}$ = 3.8 kN/m²
Imposed load category C: $N_{C,k}$ = 4.0 - 5.0 kN/m²

Spans

3.00 m to 7.00 m - in 0.50 m steps

Surface

Wood; KLH® - CLT visible

Verification criteria in case of fire

Single-sided fire exposure

Remaining of an at least 3-layers residual cross-section with two load-bearing layers, where each layer must have at least 10 mm (calculated with global charring)

4.1 VERIFICATION OF VIBRATION WITH HIGH REQUIREMENTS (WET SCREED)

The self-weight $G_{1,k}$ of the load-bearing KLH® elements is included in the tables.

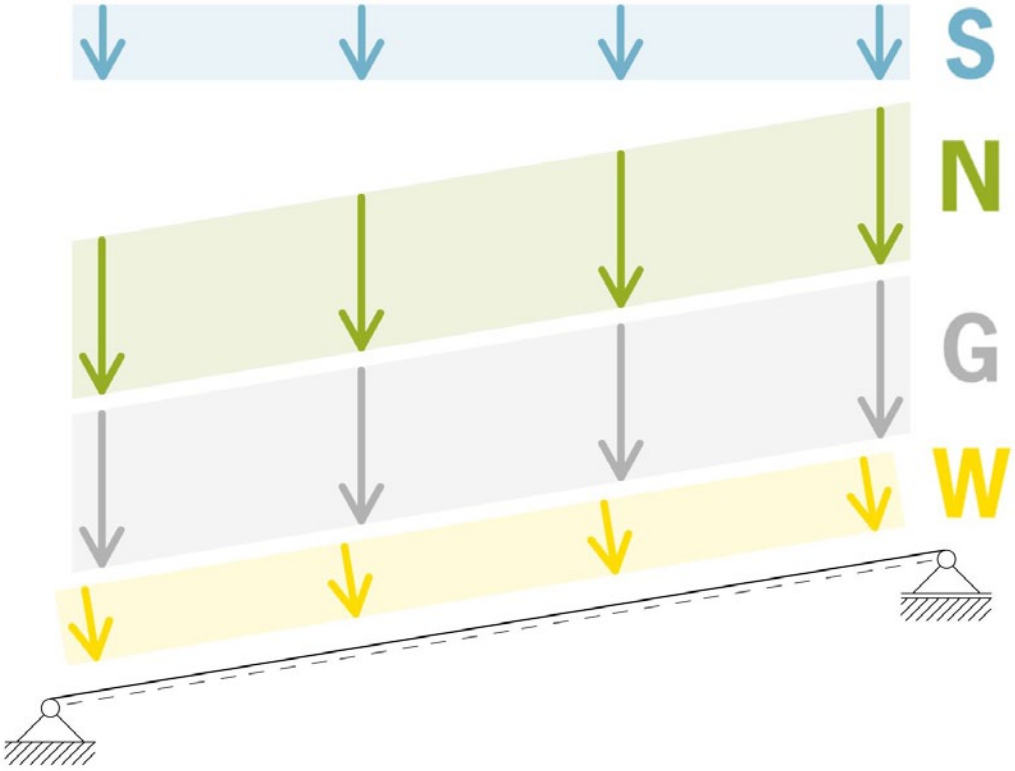
05 KLH® AS ROOF



Range for loads

Permanent load:	$G_{2,k}$ = 0.5 - 2.5 kN/m²
Imposed load category H:	$N_{H,k}$ = 1.0 kN/m²
Snow load at an altitude ≤ 1000 m:	S_k = 0.5 - 5.0 kN/m²
Wind load:	W_k = 0.4 kN/m²

Spans

3.00 m to 7.00 m - in 0.50 m steps

Surfaces

Wood; KLH® - CLT visible

Roof inclination

Maximum roof inclination of 15°
